About Elevate Software

Elevate Software is a small software company located in North Tonawanda, New York. North Tonawanda is just south of Niagara Falls and just north of Buffalo in the western end of the state of New York. We specialize in selling royalty-free database engine products (DBISAM and ElevateDB) directly to database application developers, especially those with very high distribution requirements like those that sell packaged software solutions. However, we have recently begun to expand into the web development market with the introduction of our Elevate Web Builder product. Elevate Web Builder is an integrated development environment that allows for rapid development of interactive web browser applications.

Elevate Software has a very large and loyal world-wide customer base. We do everything in our power to maintain that loyalty:

- All of our products are designed to be simple to use, and to follow existing established standards as much as possible
- All of our products are subjected to rigorous automated testing and quality assurance reviews for every new release or build
- All technical support is provided directly by the product developers
- All of our customer support plans are inexpensive, and include one-on-one phone support
- We can provide on-site consultation anywhere in the world for a modest daily fee plus expenses

History

The company was started in 1998 with the introduction of the DBISAM embedded database engine product for Borland Delphi 1/2 as a BDE (Borland Database Engine) replacement for desktop databases. DBISAM's initial feature set has since been dramatically expanded, and now includes a DBISAM Database Server and cross-platform usage under both Windows and Linux.

In 2007, Elevate Software introduced a brand new database engine product called ElevateDB that was intended to take over where DBISAM had left off. ElevateDB is a complete SQL 2003-compliant relational database engine with Unicode support, views, triggers, stored procedures and functions, constraints, and replication. ElevateDB supports most development environments available today.

In late 2011, Elevate Software introduced a brand new product called Elevate Web Builder for developing web applications. Elevate Web Builder is an integrated development environment for rapidly developing web applications, and features a compiler that compiles Object Pascal source code to 100% highly-optimized JavaScript, a WYSIWYG form designer, two-way tools that automatically generate source code for form components and event handlers, an extensive source code framework, and theming/skinning support for building beautiful and functional web applications quickly and easily.
